RINSC irradiation, overview

	Round 5	Round 6
Date	19.01.2022	26.01.2022
Target fluence [neq/cm ²]	4.00E+15	5.50E+15
Annealing time in the reactor at 60 ^{°C}	16.1 min (Front: 48.8 min, Back: 9.2 min)	115.4 min (Front: 961.5 min, Back: 18.6 min)
Order (back to front)	N4790_08, N4790_09, N4790_21	N4792_09, N4790_08, N4792_20

¹ More Info about the the profiles.

Sensor list and annealing step

sensor	annealing steps post raditation	IV grading	CV grading
N4790_09	27.6min + 31.8min	all passed	inclusive
N4790_21	10.9min + 11.7min + 11.4min + 9.6min + 11.5min + 19.9min + 11.4min + 17.2min	all passed	inclusive
N4792_7	30.9min + 31.0min	0 passed , 30 analysis not run, 60 passed	inclusive
N4790_08	no additional annealing	passed	inclusive
N4792_09	no additional annealing	passed	inclusive
N4792_20	no additional annealing	analysis not run	inclusive

Table: Annealing steps

- Sensor N4792_08 could not be located, instead the sensor N4792_07 was found in the stack

Measurement Setup: ALPS

- Sensors placed directly on chuck (no backside protection)
- Temperature: -40°C ; humidity: 4% – 8%
- Voltage provided through the HV pin to the frontside; voltage up to **-850V**
- Annealing at 60°C (chuck), target time of 115 mins
- Sensors from Round 5 were annealed to the total time of 115 min at CERN
- Sensors from Round 6 were not further annealed

Annealing effect on IV (N4790_21)

Figure: Annealing effect on IV of pad 101

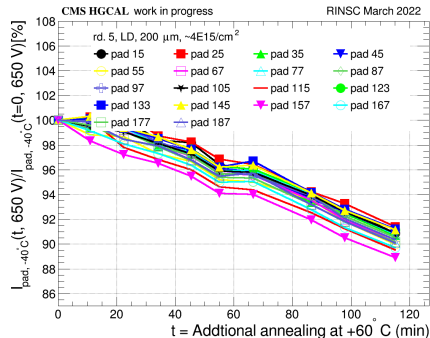

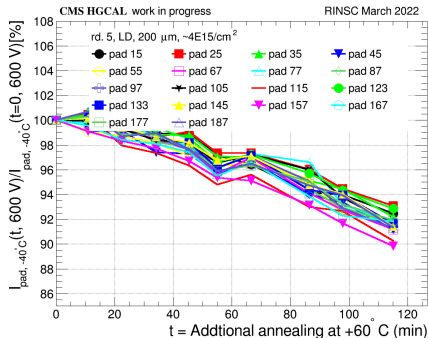

Figure: Annealing effect on IV of pad 109

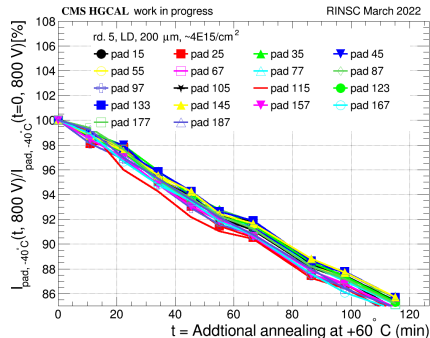

- We do see annealing effect on current
- Annealing on IV results of other channels all consistent([backup](#))

Current vs annealing time for 600V and 650V

Current vs annealing time for 700V and 800V

Annealing effect on IV results(N4790_09)

Figure: Annealing effect on IV channel 101

Figure: Annealing effect on IV channel 105

- Reached the limit at around 60 mins
- Other channels all have consistent plot(exceptions exist!)

Current vs annealing time for 600V and 650V

- Channel 15 seems to be masked at 30 and 60 annealing measurement
- Only drawing 18 channels, there could be more abnormal channels like 15
- Need to further investigate this

Current vs annealing time for 700V and 800V

Annealing effect on IV channel 15

Figure: Annealing effect on IV channel 15

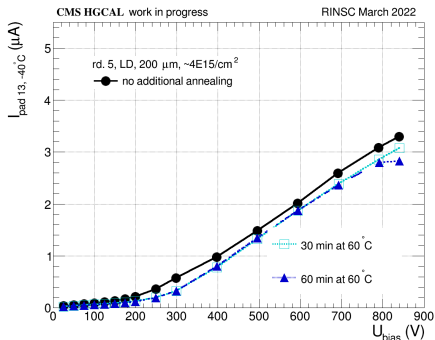

Figure: Annealing effect on IV channel 13

Annealing effect on IV results(N4792_07)

Figure: Annealing effect on IV channel 101

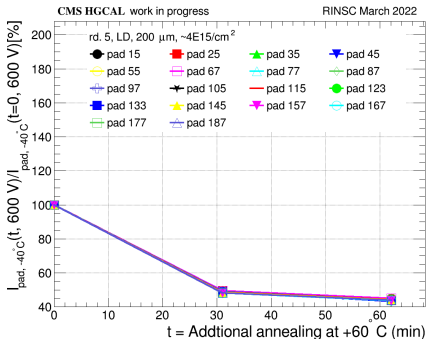

Figure: Annealing effect on IV channel 109

- Current drop is significantly higher than for other sensors
- Maybe reached the limit at around 60 mins
- Other channels all have consistent plot

Current vs annealing time for 600V and 650V

● seems too good?

Annealing on CV results N4790_21

- We do see annealing effects
- Reached the limit of reversed annealing at around 60 min
- Depletion voltage not reached

Proto-A: example CV results

- Round 5 and 6 sensors in general follow the current damage rate from previous campaigns
- Round 5 the sensor N4792_7 seems to have received more annealing during the irradiation
- Round 6 has probably been annealed significantly more than 80 mins (values for the other sensors)

Summary

- Clarify the irradiation setup with Nick to better understand the annealing during the irradiation
- Measure and analyze Round 7 & 8 sensors
